About Standard Bots

At Standard Bots, we're revolutionizing real-world automation by making robotic systems accessible to everyone. Our AI-powered platform enables robots to tackle unprecedented challenges through an intuitive instruction interface, bringing the power of software automation to physical spaces.

About the Role

We're seeking an AI Research Engineer to develop and optimize our AI models and training systems. This is an exciting opportunity to apply your deep ML expertise to cutting-edge AI/robotics applications. You'll work closely with our engineering team to design, implement, and iterate on large-scale AI models while building efficient systems for rapid experimentation and deployment. We have a small team of AI engineers, so we're looking for someone who is excited to work at a startup, and work across the stack to do what is needed to get a model that achieves a customer problem.

We're looking for an experienced engineer ready to make a tangible impact in the AI robotics revolution. This role requires a proven background working on ML planning within the autonomous vehicle space with experience using the latest techniques in diffusion and autoregressive models in a professional setting. If you're excited about building the latest advancements in AI and working in the robotics space, we'd love to hear from you.

In this role, you will:

- Design and implement state of the art ML models and training pipelines:
 - Apply novel machine learning techniques to wide range of robotics applications
 - Develop efficient data and training strategies
 - Implement model evaluation frameworks and metrics tracking
- Lead model development and iteration with focus on:
 - Rapid experimentation and prototyping of new model architectures
 - Performance optimization and model debugging
 - Transfer learning and fine-tuning strategies
- Build robust evaluation and debugging systems to:
 - Analyze model behavior and failure modes
 - Implement interpretability tools and visualization frameworks
 - Track and improve model metrics
- Collaborate with engineering team to optimize training infrastructure and deployment

You might thrive in this role if you:

- Have 5+ years of AI modeling experience, specifically within the self-driving car industry (or PhD with 3+ years of AI modeling experience in the self-driving car industry)
- Proven track record developing and deploying large-scale ML models
- Have experience using the latest techniques in diffusion and autoregressive

models in a professional setting

- Are familiar with training inference and infra pipelines that go from camera input to trajectory output for self driving or robotics
- Have experience with RL (reinforcement learning)

[Robots](#)[Software](#)[AI](#)[Applications](#)[Resources](#)[Company](#)[Support](#)

- Have a background in implementing ML research papers and adapting academic work

Tech Stack

- PyTorch (experience with PyTorch required)
- Python
- NodeJS/Typescript
- Docker

Compensation and Benefits:

The salary range for this role is \$225,000 to \$300,000, depending on experience. We are open to a variety of seniority levels for this role and will build compensation packages that are commensurate with seniority and skill level. Base salary is just one part of the

Not long ago,
computers were
hobbyist projects.
They were clunky,
limited machines
fiddled with only by

highly-trained engineers. Then came the Apple II, a marvel of vertical integration that became the first "complete, ready-to-use computer". And in an instant, everything changed.

Computing became a productivity curve bender. A tool that could be used by anybody. A joyful, interesting, and easy way to get things done.

At Standard Bots, we're taking a similar approach. We're designing better hardware and easier-to-use software together to once again accelerate what humans are capable

of achieving — this
time, with robots.
The amount of work
to get there is
immense, but so is
the opportunity.

Standard Bots
80 Pratt Oval

Team,

As you know, our goals are clear, even if the work to get there isn't:

1. Make the highest value robot hardware that's at the Pareto front in terms of price and usability. Make it easy to use without making it expensive — this combination is key.
2. Build the best API and environment for building apps on a robot. By empowering developers, we hope to help them imagine use cases that were never considered.
3. Implement and contribute to the latest in robotics. We're already making strides in areas like depth data from multi camera arrays and deep-learning-based policies for updating motion plans in realtime. There's so much more we intend to push forward with others; a rising tide lifts all robotically assembled boats.

This is just a reminder; I realize you all know this quite well. Who knows, maybe we'll screenshot this note and put it on our website so candidates can be as excited as we are.
