

Propel human
productivity through
the world's most
accessible robots.

People don't work at Standard Bots to make robots. They work here to make tomorrow easier. It's fascinating, rewarding, and most of all, incredibly difficult to do. That's why we're searching for people who are up for the challenge. Who are optimistic about the future. Who are hell-bent on accelerating human progress through the integration of hardware, software, firmware, and electronics. If you're as motivated by the possibilities as we are, join us.

Our teammates have joined us from pioneering companies:

About Standard Bots

Standard Bot's mission is to significantly lower the barrier to entry to real-world automation, bringing the power of bits to the world of atoms and unlocking productivity for entire new industries and users. Our user-facing applications and APIs directly empower individuals and developers to jump directly into solving their challenges without the need for a background in robotics or automation. A relentless focus on simplicity and ease of use brings this revolutionary potential to new users and industries.

What you'll do:

We're looking for seasoned and skilled technical leaders to help architect the future of robotics through best in class, modern software engineering practices. As a Senior Software Engineer you will work with other engineers, organizational leaders, and users to advance the products which directly impact our users and unlock entirely new

potential for them.

Location and Benefits

This role is hybrid with 3 days/week onsite in our **NYC office**, centrally located near Grand Central Station. The office is fully equipped with robots for demos and testing!

Responsibilities:

- Identify, scope, and drive high impact technical and user facing projects
- Advise leadership on technical decisions and strategy
- Mentor and advise other engineers as well as peers on technical and personal advancement
- Drive technical decision making and implementation through hands-on and technically deep work

Tech Stack:

- Front-end: React, Typescript
- Back-end: Node.js, Python, C++
- Kubernetes
- Docker
- Github Actions

Who you are

We do not require or favor any background in robotics

We're looking for engineers who are self driven, optimistic, creative, and resourceful. We have no requirements for a background in robotics, but find most success with engineers excited by the domain and looking to apply their expertise and experience in a new area.

Our ideal candidate will be open to doing approximately 70% back-end and 30% front-end work with flexibility to sway more towards one or the other, depending on current projects and team needs.

Skills you'll bring:

- **Experience:** You have a strong technical background, including 5-10 years of experience working in complex environments
- **Growth + Optimism:** You are excited by new domains and challenges, and eager to pick up new context to accelerate your impact
- **Clarity of Communication:** You excel in written and verbal communication and enjoy leveraging your skills to support your peers
- **Impact Driven:** You relentlessly seek user impact and value execution over technical idealism
- **Proactive Simplicity:** You prioritize simplicity, reliability, and velocity and

- **Excelling in Ambitious Environments:** You excel in dynamic and ambitious environments, working with a diverse group of individuals and backgrounds

Not long ago, computers were hobbyist projects. They were clunky, limited machines fiddled with only by highly-trained engineers. Then came the Apple II, a marvel of vertical integration that became the first

"complete, ready-to-use computer". And in an instant, everything changed.

Computing became a productivity curve bender. A tool that could be used by anybody. A joyful, interesting, and easy way to get things done.

At Standard Bots, we're taking a similar approach. We're designing better hardware and easier-to-use software together to once again accelerate what humans are capable of achieving — this time, with robots. The amount of work to get there is immense, but so is the opportunity.

Standard Bots
80 Pratt Oval
Glen Cove, NY 11542

Team,

As you know, our goals are clear, even if the work to get there isn't:

1. Make the highest value robot hardware that's at the Pareto front in terms of price and usability. Make it easy to use without making it expensive — this combination is key.
2. Build the best API and environment for building apps on a robot. By empowering developers, we hope to help them imagine use cases that were never considered.
3. Implement and contribute to the latest in robotics. We're already making strides in areas like depth data from multi camera arrays and deep-learning-based policies for updating motion plans in realtime. There's so much more we intend to push forward with others; a rising tide lifts all robotically assembled boats.

This is just a reminder; I realize you all know this quite well. Who knows, maybe we'll screenshot this note and put it on our website so candidates can be as excited as we are.
